

我會提供 terraform .tfvars 檔的內容給你，請產生對應的 variables.tf 程式碼

```
app_service_plans = {
  "my-appservice-plan" = {
    asp_name = "my-appservice-plan"
    asp_sku_name = "S1"
    app_services = [
      {
        name = "my-appservice-1"
        site_config = [
          {
            health_check_path = "/healthcheck"
            cors = [
              {
                support_credentials = true
                allowed_origins = [
                  "https://frontend.test.com"
                ]
              }
            ]
          }
        ]
      }
    ],
    {
      name = "my-appservice-2"
      site_config = [
        {
          health_check_path = "//healthcheck"
          cors = [
            {
              support_credentials = true
              allowed_origins = [
                "https://frontend.test.com"
              ]
            }
          ]
        }
      ]
    }
  ]
}
```

以下是對應的、**variables.tf** 程式碼：

csharp Copy code

```
variable "app_service_plans" {
  type = map(object({
    asp_name      = string
    asp_sku_name= string
    app_services= list(object({
      name        = string
      site_config = list(object({
        health_check_path = string
        cors = list(object({
          support_credentials = bool
          allowed_origins     = list(string)
        }))
      }))
    }))
  })
}
```
